A FRAGMENT OF THE ALLENDE METEORITE, THE MOST-STUDIED METEORITE ON EARTH.

IN FEBRUARY 1969, THE CAR-SIZED METEORITE BROKE INTO THOUSANDS OF SMALLER PIECES OVER THE DESERT, IN THE NORTHERN MEXICO STATE OF CHIHUAHUA. IT IS A CARBONACEOUS CHONDRITE - A VERY RARE TYPE OF METEORITE, OCCURRING ONLY 4% OF THE TIME, AND THIS IS THE LARGEST EXAMPLE EVER FOUND. AND IT CONTAINS COMPONENTS THAT ARE OVER 4.5 BILLION YEARS OLD.

Administer correction.
